

RIVERS AND FLOODS, NOVEMBER, 1910.

By Prof. H. C. FRANKENFIELD, in charge of River and Flood Division.

November, 1910, was preeminently a month of low water except in the Missouri Valley and the North Pacific States, and in many portions of the country the stages were the lowest of record. The deficiency in water supply was most pronounced in the upper Mississippi and lower Arkansas rivers, the Red River of the North, the upper Red River of the South, and in the rivers of California. More detailed accounts of the low waters will be found in the reports of the various district editors.

There were no floods during the month except a moderate one in the Willamette River and its tributaries during the closing days. The rise was caused by persistent and substantial rains from November 17 to 30, inclusive, but, owing to the moderate stages reached, no damage was done so far as is known. At the end of the month the crest of the rise had not reached Portland, Oreg.

Running ice appeared in the Missouri River at Bismarck, N. Dak., on November 6, and the river closed on November

19. Ice was first observed at Sioux City, Iowa, on November 19, but none was seen very far below that city. The Milk River froze over at Havre, Mont., on November 18, and the James River at Huron, S. Dak., on November 28. The St. Croix River at Stillwater, Minn., and the Wisconsin River at Muscoda, Wis., closed on November 17 and 18, respectively. Floating ice was first observed in the Mississippi River at St. Paul, Minn., on November 28, and on November 30 the main channel was blocked at Robert street. No ice was observed south of Muscatine, Iowa, where it was first observed on the last day of the month.

Hydrographs for typical points on several principal rivers are shown on Chart I. The stations selected for charting are Keokuk, St. Louis, Memphis, Vicksburg, and New Orleans, on the Mississippi; Cincinnati and Cairo, on the Ohio; Nashville, on the Cumberland; Johnsonville, on the Tennessee; Kansas City, on the Missouri; Little Rock, on the Arkansas; and Shreveport, on the Red.

Special papers on general meteorology.

RECENT ADDITIONS TO THE WEATHER BUREAU LIBRARY.

C. FITZHUGH TALMAN, Librarian.

The following have been selected from among the titles of books recently received, as representing those most likely to be useful to Weather Bureau officials in their meteorological work and studies. Anonymous publications are represented by a —.

Alberta (province). Department of agriculture.

Annual report. 1909. Edmonton. 1910. 251, iii p. 8°.

CONDENSED CLIMATOLOGICAL SUMMARY.

In the following table are given, for the various sections of the Climatological Service of the Weather Bureau, the average temperature and rainfall, the stations reporting the highest and lowest temperatures with dates of occurrence, the stations reporting the greatest and least monthly precipitation, and other data, as indicated by the several headings.

The mean temperatures for each section, the highest and

lowest temperatures, the average precipitation, and the greatest and least monthly amounts are found by using all trustworthy records available.

The mean departures from normal temperature and precipitation are based only on records from stations that have ten or more years of observations. Of course the number of such records is smaller than the total number of stations.

Temperature and precipitation by sections, November, 1910.

Section.	Temperature—in degrees Fahrenheit.						Precipitation—in inches and hundredths.					
	Section average	Departure from the normal.	Monthly extremes.				Lowest.	Date.	Section average	Departure from the normal.	Greatest monthly.	Least monthly.
